

RWSPC OBJECTIVES

The primary objectives and activities of the RWSPC are to:

- Utilize water-resource research findings by the state agencies (i.e., Illinois State Water Survey, Illinois State Geological Survey)
- Develop water demand scenarios to year 2050
- Evaluate water supply and demand management options as potential implementation of such options might benefit the citizens of east central Illinois
- Create a regional water-supply plan that reflects a newly developed understanding of water availability given research findings on supplies and demand scenarios and plans for growth, development and land-use change
- Propose and support outreach and public education activities

MAC Mission statement: To further study the Mahomet aquifer system, the river basins and surface waters located in the 15 county regional water supply planning area and to develop and recommend options for the planning and management of these valuable public resources.

RWSPC Mission statement: To serve as the planning committee to consider the current and future issues of water supply and demand, and to develop plans that will be recommended to appropriate local, county and state units of government and others for implementation and action.
